

Forskrivningsmodulen (e-resept) 3.4.22 (#11365)

Release Notes

22.1.2015

No component defined

Messages on the signing queue will no longer expire.

[RENO-9543]

Added support for calling the StartPasient EPJ API method with only one level Organisation element or where the top-level Organisation elements have no Id. In this case, the first Organisation element with a valid Id is used. That organisation node is used to initialize the organization selection in the medication search and prescription windows and included in the Sender element in e-resept messages.

[RENO-9552]

Fixed a defect which prevented drafts made by assistants from being rejected after more than 24 hrs and made sure the undo loop used to reject assistants suggestions works as intended, i.e. undoes until consecutive assistants touch is no longer present.

[RENO-9622]

The performance of some operations has been optimized. This is mostly related to the sign&send for multidose patients. Also, the LesAntallMeldingerForSignering EPJ API method has been optimized.

[RENO-9627]
