

Forskrivningsmodulen (e-resept) 4.11.1 RC1 (#19576),

Release Notes

4.11.2022

Customer Feature

The empty LIB option is only available for non PLL patients now.

[RENO-17484, Resolved, CLONE (4.9.9) - As a user, I don't want to empty the LIB of a PLL patient]

In dynamic reports stop date can now be selected to be included in reports and sorting order by "Bruk" has been corrected.

[RENO-17478 (704224), Resolved, CLONE (4.12) - As a user, I want to include stop date on the Fylkesmann report]

Feature

When a call from EPJ to the EPJ API web service fails because of an internal error, FM will now return proper error information, rather than just a cryptic HTTP 500 error.

[RENO-17438, Resolved, As an EPJ system, I want to receive proper error information when an EPJ API web service call fails]

Customer Defect

External items in "samstemming" that are shown as stopped by end of dosing, but without an actual treatment stop date can now be recalled.

[RENO-17483, Resolved, CLONE (4.9.9) - Missing recall option in samstemming for a stopped "ekspederbar" PLL item]

Fixed when removing lib for items that have been renewed externally (in another installation). The FM no longer shows a top text pointing out a shared treatment when the local treatment has been marked as deleted (as is done in remove LIB operation).

[RENO-17482, Resolved, CLONE (4.9.9) - Error when removing local LIB]

Loose prescriptions that come in later in a PLL as stopped and Not-In-RF are now stopped locally to avoid blocking the sending of the next PLL.

[RENO-17481, Resolved, CLONE (4.9.9) - Stopped PLL item that is no longer in RF shown in AF as not stopped]

When the latest PLL is from Pharmacy (M252) and contains a renewed version of an item that is in AF grid locally, the newer item is linked automatically over the local one, exactly like it came in on a PLL from RF (M251).

[RENO-17480, Resolved, CLONE (4.9.9) - Items from M25.2 shown as unmatched eRp in samstemming, but after "replace LIB", they are shown as "renewal to Reg" in LIB/AF]

Automatic stop from PLL now propagates better to items sharing LibIds in FM.

Specifically for a registration, if an unhandled renewal is stopped externally, both the renewed item in AF (andre forskrivninger) and on LIB (the locally active one) are updated with stop date from PLL appropriately.

[RENO-17462, Resolved, Not possible to change a Reg for a nurse in PLO]

Fixed when a local e-resept has been recalled and renewed to a registration in another installation and the new external registration was shown as "recalled" in very first samstemming after receiving recall information (m7).

[RENO-17457, Resolved, When an eRp is renewed with change and changed into Reg externally, the Reg is shown with RF status recalled in samstemming.]

When importing a treatment that has previously been removed by whole LIB operation, the import should now work properly by undoing the removed and link the imported prescription as head of history chain.

[RENO-17412, Resolved, CLONE (4.9.8) - Feil med PLL]
