## Customer Feature (1)

An admin is able to manually configure the MaxConcurrentSessions parameter for FM services.

[[RENO-17969](#), [CLONE \(4.11.2\) - As an admin, I want be able to configure the MaxConcurrentSessions parameter for FM services](#)]

## Customer Defect (5)

Null reference error fixed when doctor does RF lookup after nurses import, renew and accept registration drafts.

[[RENO-17900](#), [PLO - Error-message when doctor does RF-lookup after nurse doublesigning](#) ]

PLL items that have been deleted locally (using whole lib operation in "samstemming") are normally shown in AF grid, but after they have been removed from RF/KJ they are no longer loaded.

In addition if the local item being removed is related to the external one based on "NewReseptId" relations the item will be linked into the history of the external one.

[[RENO-17901](#), [Local item not in the newest PLL, externally renewed and stopped more then 3 mnd ago](#)]

A null references error which occurred only for prescriptions of merged patients (result of database merge) has been fixed.

[[RENO-17935](#), [NullReferenceException when opening patient that was merged from another FM database](#)]

Transitioning items from pending recall to not in RF is now possible.

[[RENO-17937](#), [Error when a resept is removed from RF while there is a pending M5](#)]

After replace LIB operation in "Samstemming" the FM now forces a complete reload of items to prevent refresh issues.

[[RENO-17944](#), [Refresh problem in AF after replacing LIB with PLL](#)]
