4.9.9 (#19532)

Release Notes

14.10.2022

Customer Defect

External items in "samstemming" that are shown as stopped by end of dosing, but without an actual treatment stop date can now be recalled.

[RENO-17439, Resolved, Missing recall option in samstemming for a stopped "ekspederbar" PLL item]

Fixed when removing lib for items that have been renewed externally (in another installation). The FM no longer shows a top text pointing out a shared treatment when the local treatment has been marked as deleted (as is done in remove LIB operation).

[RENO-17430, Resolved, Error when removing local LIB]

Loose prescriptions that come in later in a PLL as stopped and Not-In-RF are now stopped locally to avoid blocking the sending of the next PLL.

[RENO-17429, Resolved, Stopped PLL item that is no longer in RF shown in AF as not stopped]

When the latest PLL is from Pharmacy (M252) and contains a renewed version of an item that is in AF grid locally, the newer item is linked automatically over the local one, exactly like it came in on a PLL from RF (M251).

[RENO-17422, Resolved, Items from M25.2 shown as unmatched eRp in samstemming, but after "replace LIB", they are shown as "renewal to Reg" in LIB/AF]

When the latest PLL is from Pharmacy (M252) and contains a renewed version of an item that is in AF grid locally, the newer item is linked automatically over the local one, exactly like it came in on a PLL from RF (M251).

[RENO-17453, Resolved, Items from M25.2 shown as unmatched eRp in samstemming, but after "replace LIB", they are shown as "renewal to Reg" in LIB/AF]

Customer Feature

The empty LIB option is only available for non PLL patients now.

[RENO-17452, Resolved, As a user, I don't want to empty the LIB of a PLL patient]
